Laser Resurfacing

Laser resurfacing is a method used to treat a wide range of medical concerns and conditions. Because there are different intensities that the laser is capable of delivering, it can be used for both skin rejuvenation, and more dramatic changes to scars and burns.

What is laser treatment?

Using a CO2, fractional laser, our doctors can deliver pulses to the skin, which help remove dead skin cells and promote cell renewal. Due to the heat energy caused during treatment, the device also stimulates collagen production, to help firm up the skin, but also break down scar tissue and improve movement for those having a higher-setting treatment.

How many sessions?

For more superficial treatments, patient may have resurfacing treatment 6 months apart, and will on average need 2-3 sessions of treatment. If a higher setting is used, patients usually have just the one session. For scars skin and burns, the patient may need several sessions, depending on the desired

result. If the skin scars are raised or red in colour, other treatments may be administered in combination with the CO2 laser procedure.

How long will the treatment last?

Between 30- 60 minutes

What areas can be treated?

All areas

What can you expect from the final results?

Reduced wrinkles, improved texture and tone, reduction in the appearance of scars

How much downtime can I expect?

Because of the ablative nature of the laser treatment, patients should expect a downtime of 3-14 days after treatment. Patients are required to arrive at least 90 minutes before their treatment time so that anaesthetic can be applied. It is crucial that patients do not have exposure to the sun for 6 months after treatment, without using sun protection.

Who will perform the treatment?

This is a doctor & nurse led treatment at PHI .

Who is suitable ?

CO2 laser procedures can be used to treat many different indications. You may be suitable for this procedure if you desire fresher, younger-looking skin, or wish to reduce the appearance and prominence of burns and scars. Reassuringly, all skin types can be treated with the CO2 laser procedures. In summary, all patients over the age of 18. Not suitable if pregnant or breast feeding.

What our patients are saying

"I had the Total FX CO2 laser treatment on my entire back to modify a number of old acne scars, and three months on, I'm thrilled with the results. It also bears mentioning the entire experience that lead to it, starting with the clinic itself. It's Harley Street, which would usually mean a staff that's as sterile as the all-white waiting rooms, but the Phi Clinic felt like family."

What to do next?

If you are interested in having a complimentary confidential consultation please ask at reception or speak to your clinician today.
